Template Manual

Cardea HTML

Thank You :)

Thanks for purchasing template and for supporting our work. Cardea is our new fancy template. Responsive, clean and professional look with sleek design will satisfy all your needs.

You will need basic HTML, CSS, jQuery skills to edit Cardea HTML. We will try to help you out with this documentation. If we fail here, you can always contact us on <https://cocobasic.ticksy.com/> and our developers will try to solve your issue.

HTML Structure

Cardea consist several HTML files

- index.html - Front (Big) page
- portfolio-1.html
- portfolio-2.html
- portfolio-3.html
- team-1.html
- team-2.html
- team-3.html
- team-4.html
- team-5.html
- team-6.html

Front Page index.html

On Home page are placed 12 sections:

Home, Services, Portfolio, Inspire, About, News, Pricing, Skills, Team, Clients, Contact and **Milestones**. Each section is separated and start with code like this:

```
<!-- Home Section -->
    <div id="home" class="section full-width full-screen">
        ...
    </div>
```

```
<!-- Services Section -->
    <div id="services" class="section page-split">
        ...
    </div>
```

```
<!-- Team Section -->
    <div id="team" class="section page-split">
        ...
    </div>
```

Home Section

This section start with code like this:

```
<div id="home" class="section full-width full-screen">
```

Here is important class “**full-screen**” - this class will set the height of section (it this case Home section) to be minimal height as device/browser height. So, it will “stretch” to fit the full screen.

Service Section

This section start with code like this:

```
<div id="services" class="section page-split">
```

Important class here is **“page-split”** - this is the mean the section will have a layout where title is placed in one part of screen (left/right) and the content will be placed in another part of screen.

The next important part on this section is this code:

```
<div class="bg-holder float-left">  
  <div class="split-color"></div>  
</div>  
<div class="sticky-spacer">  
  <div class="section-title-holder float-left">
```

Here is important class **“float-left”** (that class is used **twice** in code above) with this class you can set the title to be on left part of screen or with class **“float-right”** to be on right part of screen.

With this code:

```
<div class="section-content-holder float-right">  
  <div class="content-wrapper">
```

start the right part of service section (place where the content is placed). As you see, here is used **“float-right”** class, so the title will be on left part and content on the right part. If you need to switch the

positions, just switch this two classes (note, you need to do on **three** places).

Also, on Service section you will find code like this for service item:

```
<div class="one_half animate">
    <div class="service-holder">
        <div class="service-img">
            
        </div>
        <div class="service-txt">
            <h4>Preciese</h4>
            Phasellus vel est sem integer suscipit enim quis dictum.
        </div>
    </div>
</div>
```

On Cardea HTML are several elements which have fadeIn animation when the element comes in viewport (one example is above for service item). To add element animation, all you need to do is to add class **"animate"**. For example:

```
<div class="one_third animate">
```

Also, there are classes which allows you to set 0.1s - 1.5s animation delay ("**wait-01s**", "**wait-02s**" ... "**wait-14s**", "**wait-15s**"). Use it like this:

```
<div class="one_third animate wait-07s">
```

Portfolio Section

There is difference between demo-1 and demo-2 in portfolio layout - in demo-2 there is **no padding** around the portfolio grid. The difference in code is just in one extra class **"no-padding"** (we have use the same class for **"Team"** section):

```
<div id="portfolio" class="section page-split no-padding">
```

Portfolio Items Links - here we have 2 different ways how we can link portfolio items. On our demo, the first 3 items are linked via ajax and load content inside the home/front page.

The 4rth and 5th item is linking to popup image and video.

Here is a example for portfolio item which is loading content via ajax:

```
<div id="p-item-1" class="grid-item element-item p_one">
  <a class="item-link ajax-portfolio" href="portfolio-1.html" data-id="1">
    
    <div class="portfolio-text-holder">
      <p class="portfolio-title">Smartphone</p>
      <p class="portfolio-desc">BUSINESS CARDS</p>
    </div>
  </a>
</div>
```

Portfolio item content is loaded in page using Ajax. The important part here is this 2 lines of code:

```
<div id="p-item-1" class="grid-item element-item p_one">  
    <a class="item-link ajax-portfolio" href="portfolio-1.html" data-id="1">
```

Class **“ajax-portfolio”** must be included if you want to have in page/ajax load. If you remove this class, the link will work on “regular way” and will open the page which you have set in **“href”**. Another important part, is to set unique **data-id** number of each item like: **data-id="1" , data-id="2" , data-id="3"**

Also, the **id="p-item-1"** must be unique for each item.

So, when you click on portfolio item image, the ajax will load the content from html file which is set in **“href”** attribute (in example above it is **“portfolio-1.html”** file).

The ajax will load a whole file, but we are displaying only content which is placed inside this div:

```
<div class="portfolio-item-wrapper center-relative">  
...  
</div>
```

All content which is placed inside this div will be loaded and displayed on front/home page (index.html) using Ajax.

The another way of linking portfolio items is to link to image/video popup video (4rth and 5th items in portfolio on our demo). Here is example:

```
<div class="grid-item element-item p_one_half">
  <a class="item-link" href="images/img_05s.jpg" data-rel="prettyPhoto[portfolio]">
    
    <div class="portfolio-text-holder">
      <p class="portfolio-title">Tower</p>
      <p class="portfolio-desc">SKYSCRAPER</p>
    </div>
  </a>
</div>

<div class="grid-item element-item p_one">
<a class="item-link" href="https://www.youtube.com/watch?v=15cpIHjEsWI" data-rel="prettyPhoto[portfolio]">
  
  <div class="portfolio-text-holder">
    <p class="portfolio-title">A4 Paper</p>
    <p class="portfolio-desc">PSD MOCKUP</p>
  </div>
</a>
</div>
```

Inspire Section

Here you will find code like this (image slider code):

```
<script>
    var slider1_speed = "2000";
    var slider1_auto = "true";
    var slider1_hover = "true";
</script>
<div class="image-slider-wrapper relative">
    <div id="slider1" class="owl-carousel owl-theme image-slider slider">
        <div class="owl-item">
            <a href="#services" class="scroll">
                
            </a>
        </div>
        <div class="owl-item">
            <a href="#team" class="scroll">
                
            </a>
        </div>
        <div class="owl-item">
            <a href="#contact" class="scroll">
                
            </a>
        </div>
    </div>
</div>
```

If you need one more slider, duplicate that code and change “**slider1**” string on several places with new string, for example “**slider2**”. So you will have “**slider2_speed**”, “**slider2_auto**”, id=“**slider2**”...

About Section

Here you will find code for video popup:

```
<a class="video-popup-holder" href="https://www.youtube.com/watch?v=15cpIHjEsWI"
data-rel="prettyPhoto[gallery-video1]">
    
    
</a>
```

You can set a Vimeo or YouTube video in popup, but you must use this format:

YouTube video in format:

<http://www.youtube.com/watch?v=XXXXXXX>

or Vimeo video in format:

<http://vimeo.com/XXXXXXX>

Team Section

Here you will find code for team member:

```
<li id="team-member-1" class="member-holder one_half">
    <a class="img-link ajax-member-content" href="team-1.html" data-id="1">
        
        <div class="member-mask">
            <div class="member-info-holder">
                <p class="member-name">Mark Stone</p>
                <p class="member-position">CEO</p>
            </div>
        </div>
    </a>
</li>
```

Team member content is loaded in page using Ajax. The important part here is this line of code:

```
<a class="img-link ajax-member-content" href="team-1.html" data-id="1">
```

Class “**ajax-member-content**” must be included if you want to have in page/ajax load. If you remove this class, the link will work on “regular way” and will open the page which you have set in “**href**”. Another important part, is to set unique **data-id** number of each member like: **data-id="1"** , **data-id="2"** , **data-id="3"**

So, when you click on member image, the ajax will load the content from html file which is set in “**href**” attribute (in example above it is “**team-1.html**” file).

The ajax will load a whole file, but we are displaying only content which is placed inside this div:

```
<div class="member-item-wrapper center-relative">  
...  
</div>
```

All content which is placed inside this div will be loaded and displayed on front/home page (index.html) using Ajax.

Mail Configuration

Note: Do not remove any quote or double quote signs while doing this.

One notice: this will be functional only on your server, php file can not be executed on your local computer.

Just add your own email address here in your **config.php** file.

```
//SITE GLOBAL CONFIGURATION
```

```
$email = "your@email.here"; //<-- Your email
```
